

Measuring Advice

Measuring for your blind doesn't take long. You will need:

✓ *Metal Tape Measure*

✓ *Pen & Paper*

✓ *A little patience*

You can measure in metric or imperial. Measure to within a couple of millimetres for metric and one sixteenth of an inch for imperial. Always double check your measurements...

Inside Recess

Measure the width of the recess from wall to wall exactly at the top, middle and bottom. Next measure the drop inside the recess in three places as shown. Note down all of these measurements

There is no need to make any allowances, we will do that for you

Outside Recess

Start by measuring the 'inside recess' as before. Next measure how far you would like your blind to overlap your window on either side. Next decide how high up you would like your blind to start and measure how far down you would like it to finish

Make a note of all these measurements

Child Safety and the 'Installation Height'

If you require blinds that have operating cords or chains, regulations will mean cord and chain lengths are determined by the European standard, and a safety device is needed. To determine the cord length, we require a measurement called the 'Installation Height'. This is the distance from where the top of the blind will be fitted all the way down to the floor. The regulations apply to all windows, even ones with an obstruction in the way e.g. a kitchen worktop

Key points to remember...

- Use a Metal Tape Measure
- Measure width & drop in three places
- Measure the 'Installation Height'
- Check for obstructions
- Check clearances for handles etc.
- Note down all your measurements
- Always double check
- Give us a call, if you're unsure

Important note...

Ball Hill Blinds cannot be held responsible where inaccurate measurements are provided to us by the customer

Always double check your measurements
